[1]The American Community Survey (ACS) has been conducted annually by the U.S. Census Bureau since 2005. Whereas the Decennial Census (DC) strives to reach every residence and uses a brief form, the ACS targets a sample of the total population and includes many items (the ACS replaced the previous DC "Long Form"). The ACS is sent to approximately 3 million residences each year. Since ACS results are extrapolated from a relatively small sample size, there may be significant error rates in the estimates – in some cases, data may appear to be inconsistent from one year to the next. However, ACS data is useful in monitoring gross trends over a period of time. (ACS estimates are available in single- and multi-year reports, each using different methodologies, but the Census Bureau recommends the 1-year reports for longitudinal comparison, and data from the 1-year reports are presented here.) Only the DC provides population data in single-age cohorts, while the ACS provides population data in certain age groups. For comparison with AISD enrollment, the combined age group of 5-17 is used (5-19 is also available, but not 5-18).

[2]From annual AEIS and TAPR reports generated by TEA.

[3]ACS data are available by a number of specific geographical areas, including school districts. All of the data presented pertain to the area specifically within the boundaries of AISD.

[4]Population age 25 and over.

[5]Births per 1,000 women ages 15-50.

[6]K-12 enrollment (not counting PK and EC) is probably the closest comparison to the 5-17 age group (see Footnote #1).

[7]Other than spouse or child.

[8]Languge other than English.
