AISD Lice Prevention, Control, and Treatment Policy
Updated, 2015

Based on recommendations from the American Academy of Pediatrics (AAP) 2015 and the 2013 update to the Texas Administrative Code (TAC Title 25, part 1, Chapter 97, Subchapter A, Rule 97.7), Austin ISD has updated its’ Lice Prevention, Control, and Treatment Protocol to reflect the most current guidelines in the control of lice.

**Students should not be excluded from school due to head lice.** The Centers for Disease Control and Prevention (CDC), the American Academy of Pediatrics (AAP), and the Texas Department of State Health Services (DSHS) support that there is little evidence that exclusion from school reduces the transmission of head lice (Texas Department of State Health Services, 2007, 2014).

Head lice are common for children ages 3-12. Head lice are not a health hazard and are not responsible for the spread of any disease. They are the cause of much embarrassment, misunderstanding, and many unnecessary days lost from work and school. “No-nit” policies which keep kids with lice home as long as they have any evidence of an infestation don’t benefit these kids or their classmates and “should be abandoned” (American Academy of Pediatrics, 2015).

The goal of lice prevention and control in schools is to limit the spread of lice from one student to another student through accurate diagnosis, and meaningful and consistent communication and education (AAP, 2015). Lice control takes teamwork among home, school, after-school programs, and events in private or public locations, including student visits in each other's homes.

Questions regarding AISD Lice Policy, Protocol, and Procedures should be directed to the campus school nurse, the Department of Comprehensive Health Services at 512-414-9778, or Office of Student Health Services at 512-324-0195.
Live Lice and Nit Prevention, Control, and Treatment Procedural Guidelines

Initial Identification of Infestation

Cases of lice should be confirmed by the RN, School Health Assistant or trained AISD staff.

Live Lice

- All students identified with live lice will be sent home at the end of the school day after contacting parent/guardian by phone. They should not be excluded from school.
- Parents/Guardians will be advised to treat their child for head lice. Educational materials about treatment and prevention will be given and explained to parent/guardian.
- Parents/Guardians should notify close contacts of diagnosis.
- Based on the AAP (2015) recommendations, alert letters will only be sent home in the event of a 50% or greater number of students infested in a classroom to the parents of that specific classroom. Because alert letters may violate privacy and cause unnecessary public alarm, parents of infested student when the number does not meet the threshold, should be strongly encouraged to notify close contacts of diagnosis and reminded that the school will not be sending out “Alert” letters.

Nits

- Students identified with nits only will have their parent/guardian contacted by the school nurse to see if treatment has taken place within the last seven days.
- Educational material about nit removal and prevention of lice will be provided to parent/guardian.

Requirements for Readmission to School

- If live lice are found at re-check, the RN should be contacted to assess the adequacy or understanding of treatment, check for any problems or barriers that may prevent live lice removal, and counsel the family on treatment options.
- The student may remain in school unless otherwise recommended by the health team.

Treatment Failures and Frequent Re-infestations

- If live lice are found following treatment, the RN should be notified. The RN will investigate and make further recommendations to the family.
**Classroom Control Measures:**

- The Health Team will provide teachers with the "Checklist for Classroom Lice Control." Contact the RN for any questions regarding classroom lice control.

- Teachers are expected to follow the guidelines to prevent the spread of lice.

- At all times, schools are encouraged to discontinue fabric-covered items, i.e., pillows, blankets used by more than one child. Teachers may request storage bags to separate all coats/sweaters. Teachers, Assistants, and Monitors should not allow piling of coats.
Responsibilities

Student Health Services

- The health team will Screen students sent to health room displaying symptoms
- Screening will be done on an individual basis for students reporting or demonstrating symptoms (i.e. lice visible in hair, scratching scalp). Current evidence does not support the efficacy and cost effectiveness of classroom or school wide screening for decreasing the incidence of head lice among school children (Centers for Disease Control, 2007) (American Academy of Pediatrics, 2015)
- The RN will distribute educational materials about lice to parents and staff throughout the year, i.e. submit newsletter articles, via student folders, or school websites.
- The RN will provide health teaching to students, staff, and parents regarding prevention, detection and treatment of lice as needed.
- The RN will follow-up with parents/guardians on cases that were identified by Designated Health Services Support Member (AISD staff) when no Health Team staff was available on campus.

Designated Health Services Support Member (AISD staff)

- All staff members should be familiar with the signs and symptoms of lice infestation. Detection of lice or nits, or suspicion of lice or nits, should be promptly reported to the Health Team or designated, trained office staff.
- If the RN or School Health Assistant is not on campus, the Designated Health Services Support Member will screen students sent by the teacher suspected of having lice.
- If live lice are found, and the Health Team staff will not be on campus that day, the Designated Health Services Support Member will notify the RN and send home with the individual student a notification letter and educational materials provided by the Health Team.

Teaching Staff

- Survey the classroom environment regularly for students displaying signs of lice or items in the classroom that could be contributing to the spread of lice.
- Implement the “Checklist for Classroom Lice Control” and make appropriate changes. (See Appendix for Checklist).
Teaching Staff (continued)

- Send students to health room for inspection by the School Health Assistant or RN if student has visible lice or uncontrolled scalp scratching.
- Forward any reports of lice received from parents/guardians to the RN for educational follow-up.

Parent/Guardian

- Parents/Guardians need to make lice screening a part of their family routine. Parents should check their children’s head at least weekly. School screenings do not take the place of these more careful parental checks (AAP, 2015).
- Parents/Guardians should follow the recommendations and/or treatment guidelines from Student Health Services.
- Parents/Guardians should consult their health care provider and/or school nurse for concerns about effective treatments.
- Parent/Guardians should notify close contacts of live lice diagnosis.

Community Education and Cooperation

- The lice prevention, control, and treatment protocol will be shared with AISD staff and staff of after-school programs for implementation in these programs, thus allowing for consistency when children are in school environments.
- The lice prevention, control, and treatment protocol and educational information may be shared as requested with Austin’s private or parochial schools and with major after-school organizations, i.e., athletic or recreational facilities.
- Educational materials such as videos, flyers, books, and posters are available from Children's/AISD Student Health Services Administrative Office at Dell Children’s Medical Center and may be checked out to RNs for parents, teachers, or group education.
Lice Educational Resources
Screening Procedure

1. **Only** the RN, School Health Assistant, and trained Designated Health Services Support Member (AISD staff) will be responsible for screening. Classroom teachers are only responsible for classroom surveillance.

2. Provide as much privacy as possible. Do NOT indicate that a student has lice/nits in the presence of the other students.

3. Use two objects long enough to separate the hair and expose the scalp. Non-sterile cotton-tipped applicators, coffee stir sticks, etc. can be used.

4. Check the back of the head and around the ears. If the hair is short in the back, check the area of the head where the hair is longer. If the child is itching, check the entire head.

5. Separate the hair and look for nits and moving lice. Nits will **not** move when the strand of hair is flicked. Dandruff, hair casts, lint and other debris **will** move when the strand of hair is flicked. Dispose of cotton tipped applicators or coffee stir sticks after one use.

6. Wash hands. Gloves are unnecessary.

7. Document findings either in SHIS or the AISD Personnel Log, as applicable.
Checklist for Classroom Lice Control

_______ Play items (hats, wigs, dress up clothes, etc.) cleaned after each child’s use

_______ Sweaters, backpacks, and coats hung separately on hooks and not touching. Sweaters, coats, and hats can often be placed in each student’s backpack

_______ Children’s personal items (combs, brushes, hats, scarves, sweaters, coats etc.) are not shared

_______ Carpet is vacuumed after a live lice diagnosis.

_______ No sharing of cloth or upholstered pillows, mats, etc.

_______ Nap items (pillows, blankets, towels, etc.) are stored separately in a cubby or plastic bag and taken home at least weekly to be washed.

_______ Headphones are wiped with disinfectant after each child’s use

_______ Observation of children for:
  - Nits/lice in hair (on nape of neck, over ears, and within ¼ inch of scalp)
  - Continuous scratching of head and neck
INSTRUCTIONS FOR TREATMENT AND CONTROL OF HEAD LICE AND NITS

- **Use a pediculicide** lice shampoo or treatment. You might want to ask your doctor or pharmacist for recommendations. Follow directions on the bottle **exactly**. **Do NOT use flea shampoo, alcohol, or gasoline. These are very dangerous and not proven to be effective.**

- Repeat pediculicide (lice) shampoo treatment of the hair in 7 to 10 days (depending upon the pediculicide used) to assure that if any nits have hatched, the new lice will be killed before they can lay more eggs.

- **Comb or pick out the nits**: Using a good metal nit comb, comb the hair section by section. Nit removal aids in decreasing the risk of self-reinfestation.

- **Clean environment**: To ensure better treatment outcomes, household cleaning should be done on the same day as the child’s treatment.
  - Soak combs and brushes for one hour in a pediculicide lice shampoo or five to ten minutes in hot water (130°).
  - Change into freshly washed clothes after treatment.
  - Change and wash all sheets, pillowcases, blankets, and towels in hot water (130°) and machine dry on hot setting for at least 30 minutes.
  - Wash all clothes, coats, and hats work in the past 48 hours.
  - Rugs, carpets, and upholstered furniture, including the upholstery in the car, can be vacuumed.
  - Pillows, stuffed animals or non-washable items may be either dry cleaned, or sealed in a plastic bag for 7 days or placed in a dryer for 20 minutes of hot air.
  - Exhaustive cleaning measures are not beneficial.
Helpful Hints for Nit Removal

Removing nits is the most important step in preventing the recurrence of head lice. For the initial treatment, use a pediculicide shampoo or treatment to kill the live lice and then:

- Comb the hair with a regular comb if the hair is thick and/or long to remove the tangles.
- Comb the hair into one-inch sections and remove the nits in each section by using a metal nit or flea comb.
- A metal nit comb can be reused if washed and boiled.
- Remove remaining nits by hand if necessary.
- Remember the key to successful lice treatment is complete removal of ALL nits close to the scalp (1cm or closer) Nits farther away from the scalp should be removed for aesthetic reason, to reduce diagnostic confusion and the chance of unnecessary retreatment, and to reduce social stigmatization.

Helpful Hints for Cleaning the Environment

- Soak combs and brushes for one hour in a pediculicide lice shampoo or five to ten minutes in hot water (130°).
- Change into freshly washed clothes after treatment.
- Change and wash all sheets, pillowcases, blankets, and towels in hot water (130°) and machine dry on hot setting for at least 30 minutes.
- Wash all previously worn clothes, coats and hats.
- Vacuum rugs, carpets and upholstered furniture, including the upholstery in the car.
- Pillows, stuffed animals or non-washable items must be either dry cleaned, washed, sealed in a plastic bag for 7 days or placed in a dryer for 20 minutes of hot air.
Sugerencias útiles para quitar las liendres

Quitar las liendres es el paso más importante para prevenir la recurrencia de piojos en la cabeza. Para el tratamiento inicial, use un champú pediculicida o tratamiento para matar las liendres y después:

- Peine el cabello con un peine regular si el cabello es grueso o largo, para desenredarlo.
- Peine el cabello en secciones de una pulgada y quite las liendres en cada sección usando un peine de metal para liendres o pulgas.
- Puede volver a usar un peine de metal si lo lava y hierva.
- Si es necesario, quite con los dedos las liendres que queden.
- Recuerde que para el tratamiento para liendres tendrá éxito si quita completamente TODAS las liendres.
- Para ayudar a quitar las liendres puede usar aceite de oliva y dejarlo reposar en el cabello por 4 horas, lo que hará más fácil quitarlas. Otros productos que puede comprar para quitar liendres sin receta médica son Clear, Step 1, mayonesa y una solución de vinagre y agua (una ración de vinagre por una de agua).

Sugerencias útiles para limpiar su entorno

- Remojar cepillos y peines por una hora en un champú pediculicida para piojos, o de cinco a diez minutos en agua caliente (130°).
- Después del tratamiento, ponerse ropa limpia.
- Cambiar y lavar todas las sábanas, fundas y colchas en agua caliente y secarlas en la secadora a temperatura caliente.
- Lavar toda la ropa, abrigos y sombreros que hayan sido usados.
- Aspirar alfombras, tapetes, incluyendo la tapicería del auto.
- Almohadas, animales de peluche o artículos que no se pueden lavar deben lavarse en seco, lavarse con agua y jabón, ponerse en una bolsa de plástico herméticamente cerrada por 7 días o colocarlos en la secadora de ropa por 20 minutos en aire caliente.

RE: HEAD LICE

Dear Parent/Guardian:

Your child, ______________________________________, has signs and symptoms of head lice. Even though they do not jump or fly, they can be spread from one person to another by close personal contact, and sharing personal items such as combs, brushes, clothing, and hats. Head lice can happen to anyone. It is not a sign of poor health habits, being dirty, or poor parenting.

To control the spread of head lice, please treat your child with a pediculicide shampoo or treatment.

It is recommended that all household members be checked and those with evidence of an active infestation should also be treated at the same time. The student will be checked for live lice upon returning to school by the health team or school office staff. Please have your child report to the office before going to class.

Working together we can meet this challenge. I have provided information about treatment and prevention. I will be calling to follow-up in a few days. I am available to discuss any questions you might have concerning this matter.

School Nurse                                  Telephone Number
TO: Parents of ____________________________ class

FROM: Children's/AISD Student Health Services

SUBJECT: HEAD LICE IN THE CLASSROOM

FOR YOUR INFORMATION: There are a significant number of students in your child's class with documented cases of head lice. We are sending you this letter to inform you of the high percentage of head lice and to encourage you to **check your child this evening and at least once a week**. Please be reassured that head lice are not considered a medical or public health hazard.

Head lice are parasitic insects which live on the scalp. The signs and symptoms of head lice are:

- a. Persistent itching and scratching of the scalp.
- b. Live lice are white and about 1/16 inch long.
- c. The lice eggs are called nits and are shiny grayish, unlike dandruff they do not come off easily.

**NOTE:** Nits are shiny, grayish and look like dandruff, but won’t flick off.

Head lice do not hop, jump, or fly. They crawl from one person to another by direct contact and by use of infested articles. To control and avoid lice:

- a. Do not share hats, coats, headgear, combs or brushes.
- b. Inspect hair weekly for presence of lice and nits.
- c. Notify your child's school, day care center, or nursery if you find lice/nits.
- d. Treat promptly if you find live lice.

If you find your child has head lice, please notify the health team. Material about prevention and treatment of head lice are also attached. Please call if you have any questions or concerns.

Re: Head Lice Education

Dear Parent or Guardian:

Welcome back! I am looking forward to a productive and enriching new school year.

As you may know, head lice cases have been on the rise. An estimated 6 to 12 million infestations occur each year in the United States, most commonly among children ages 3 to 11. I am writing to you to help you learn how to identify lice and provide information on what you can do if lice hit your home.

What are head lice?
Head lice are tiny, wingless insects that live close to the human scalp. They feed on blood. The eggs, also called nits, are tiny, tear-drop shaped eggs that attach to the hair shaft. Nits often appear yellowish or white and can look like dandruff but cannot be removed or brushed off. The nymph, or baby louse, is smaller and grows to adult size in one to two weeks. The adult louse is the size of a sesame seed and appears tan to grayish-white. An itchy and inflamed scalp is a common symptom of lice. Although not common, persistent scratching may lead to skin irritation and even infection.

Who is affected by head lice?
Head lice are not related to cleanliness. In fact, head lice often infest people with good hygiene and grooming habits. Infestations can occur at home, school or in the community. Head lice are mostly spread by direct head-to-head contact—for example, during play at home or school, slumber parties, sports activities or camp. Less often, lice are spread via objects that have been in recent contact with a person with head lice, such as hats, scarves, hair ribbons, combs, brushes, stuffed animals or bedding.

What to do if an infestation occurs?
If you think your child has head lice, it’s important to talk to a healthcare provider to discuss the best treatment approach for your family. Resistance to some over-the-counter head lice treatments has been reported, but the prevalence of resistance is not known. There are new prescription treatment options available that are safe and do not require nit combing.

As your school nurse, I want to provide you with the information you need to safeguard your children’s health and pave the way for a healthy school year. I hope you find this information useful.

Sincerely,

[Name]    Contact number
