# Results of the 2015 Student Substance Use and Safety Survey

## Bailey Middle School Report

Department of  
Research and Evaluation  
AUSTIN INDEPENDENT SCHOOL DISTRICT

## Description of Survey

Every year, the Austin Independent School District (AISD) administers the Student Substance Use and Safety Survey (SSUSS) to a random, representative sample of AISD middle and high school students. The survey tracks self-reported student knowledge, attitudes, and behavior. In the spring of 2015, a sample of 9,089 students in grades 6 through 12 submitted valid responses to the survey, yielding a response rate of 78%<sup>2</sup>. This report includes respondents' demographics and all survey results. The report presents survey questions by topic, and includes results from the 2013–2014 school year for year-to-year comparisons.

## How should I interpret sample data?

When it is not feasible to survey an entire population, researchers may use samples instead. When using a sample to make inferences about a population, interpret results with caution. For example, although 87% of a sample may select a particular survey response, this does not necessarily mean 87% of the entire population feels the same way. To interpret the sample data cautiously, researchers from the AISD Department of Research and Evaluation used the following information to construct an interval that describes the range within which results for your campus population are likely to fall:

Population size: The number of students at your campus

Sample size: The number of survey respondents from your campus

Desired level of confidence: 95%

The 95% confidence interval is used regularly, indicating that you can be 95% confident that the true population result falls within the constructed interval.

## How should I use confidence intervals to interpret campus data?

*Based on the Bailey Middle School sample of 307 students and population enrollment of 920, the confidence interval for Bailey is + and - 5 percentage points.*

The interval for the all middle schools category is + and -1 percentage point.

To make inferences about your campus population using the sample data, interpret results with the confidence interval of 5 percentage points on each side of the sample statistics. For example, in 2015, 15% of respondents from Bailey indicated they had friends who belonged to a gang (see Q16, p. 11). Applying the confidence interval (i.e., adding and subtracting 5 percentage points) to the 15% yields a range of 10% to 20%. Therefore, you can be 95% confident that between 10% and 20% of all students at Bailey would indicate that some of their friends belong to a gang. When making comparisons between item results from year to year, remember that small changes may have occurred by chance. The confidence interval for 2014 was 4 percentage points. Therefore, only consider differences of 9 percentage points (5% + 4%) or greater as statistically significant when comparing the results between these two school years. In addition, only consider differences of 6 percentage points (5% + 1%) or greater as statistically significant when comparing the results between the campus and all middle schools.

<sup>2</sup> A total of 9,484 surveys were returned to the Department of Research and Evaluation from an original sample of 11,666 students. Of those returned, 395 surveys were removed from analysis due to invalid responses.
