

Results of the 2010 Student Substance Use and Safety Survey

FULMORE MIDDLE SCHOOL

Description of Survey

The federal Title IV Safe and Drug Free Schools and Communities grant requires annual needs assessment and evaluation of substance use and safety issues. Consequently, each year a self-report student survey of substance use and school safety is administered to a random, representative sample of AISD students. The survey is used to track student knowledge, attitudes, and self-reported behavior over time. In the Spring of 2010 a sample of 8,162 students in grades 6-12 submitted valid responses to the district's annual survey of substance use and safety issues, yielding a response rate of 70%.⁷ Selected item results are attached. These results should be shared with the campus Positive Behavior Support (PBS) team, Campus Advisory Council, and others involved in campus safety planning efforts for your school.

How should sample data be interpreted?

When it is not feasible to survey an entire population, samples are used instead. However, when a sample is used to make inferences about a population the results must be interpreted with caution. For example, although 87% of a sample may select a particular survey response, this does not necessarily mean 87% of the entire population feels the same way. To interpret the sample data cautiously, we have used the following information to construct an interval that describes the range within which the result for your campus population is likely to fall:

- Population size: In this case, the number of students at your campus.
- Sample size: In this case, the number of survey respondents from your campus.
- Desired level of confidence: In this case, 95%.

The 95% confidence interval is commonly used, indicating that you can be 95% confident that the true population result will fall within the constructed interval.

How should Confidence Intervals be used to interpret your campus data?

Based on the Fulmore Middle School sample of 205 students and population enrollment of 964, the confidence interval for Fulmore Middle School is + and – 6 percentage points.

To make inferences about your campus population using the sample data, the results should be interpreted with the computed confidence interval of 6 percentage points on each side of the sample statistics. For example, in 2010 32% of respondents from your campus indicated that their friends belonged to gangs (see Q16, p.9). Applying the confidence interval (i.e., adding and subtracting 6 percentage points) to the 32% yields a range of 26% - 38%. Therefore, you can be 95% confident that somewhere between 26% - 38% of all students at your campus would indicate that their friends belong to a gang. When making comparisons between item results from year to year, please remember that small changes may have occurred by chance alone. The confidence interval for 2009 was 5 percentage points. Therefore, only differences of 11 percentage points or greater (5%+6%) should be considered statistically significant when comparing the results from two different years.

⁷ A total of 8,521 surveys were returned to the Department of Program Evaluation from an original sample of 11,593 students. Of those returned, 359 surveys were removed from analysis due to invalid responses.
