

## LBJ HIGH SCHOOL

### DESCRIPTION OF SURVEY

Every year a self-report student survey of substance use and school safety is administered to a random, representative sample of AISD students. The survey is used to track student knowledge, attitudes, and self-reported behavior over time. In the spring of 2012 a sample of 8,725 students in grades 6-12 submitted valid responses to the district's annual survey of substance use and safety issues, yielding a response rate of 74%.<sup>1</sup> All item results are attached.

### HOW SHOULD SAMPLE DATA BE INTERPRETED?

When it is not feasible to survey an entire population, samples are used instead. However, when a sample is used to make inferences about a population the results must be interpreted with caution. For example, although 87% of a *sample* may select a particular survey response, this does not necessarily mean 87% of the entire *population* feels the same way. To interpret the sample data cautiously, we have used the population size and sample size to construct a 95% confidence interval for each item, allowing you to be 95% confident that the true population result will fall within the constructed interval.

### HOW SHOULD CONFIDENCE INTERVALS BE USED TO INTERPRET YOUR CAMPUS DATA?

***Based on the LBJ HS sample of 157 students and population enrollment of 1,093 , the confidence interval for LBJ HS is + and – 7 percentage points.***

***Interval for All high schools is + and -1.5 percentage points.***

To make inferences about your campus population using the sample data, the results should be interpreted with the computed confidence interval of 7 percentage points on each side of the sample statistics. For example, in 2012, 25% of respondents from your campus indicated that their friends belonged to gangs (see Q16, p.10). Applying the confidence interval (i.e., adding and subtracting 7 percentage points) to the 25% yields a range of 18% - 32%. Therefore, you can be 95% confident that somewhere between 18% - 32% of all students at your campus would indicate that their friends belong to a gang. When making comparisons between item results from year to year, please remember that small changes may have occurred by chance alone. The confidence interval for 2011 was 6 percentage points. Therefore, only differences of 13 (6%+7%) percentage points or greater should be considered statistically significant when comparing the results from two different years. In addition, differences of 8.5 (7+1.5) percentage points or greater should be considered statistically significant when comparing the results between the campus and all high schools.

This report presents respondent demographics followed by survey items related to both school safety and substance use, then items related to school safety, and finally items related to substance use. For each campus, results of the 2012 and 2011 surveys are presented to allow for year to year comparisons. The all high school results are presented to allow comparisons between your campus and all other AISD high schools. The question numbers correspond to the item number on the survey.

<sup>1</sup> A total of 9,139 surveys were returned to the Department of Program Evaluation from an original sample of 11,829 students. Of those returned, 586 surveys were removed from analysis due to invalid responses.
